SAKSHI — Synthetic Evidence Test Fixture

PDF text-extraction, indexing, and retrieval validation

TEST DATA ONLY — NOT A REAL CASE
All names, identifiers, dates, locations, observations, and events in this document are fictional. Do not use this fixture as evidence or as a template for a real investigation.

Fixture metadata

Fixture ID	SAKSHI-RAG-TEST-2026-042
Document type	Synthetic text-based PDF
Purpose	Validate authorized upload, evidence protection, PDF extraction, RAG indexing, and source provenance
Unique retrieval phrase	BLUE ORCHID 7319 — synthetic retrieval marker

Purpose and handling note

This document exists only to test the SAKSHI software pipeline. It contains deliberately invented administrative notes and no real allegations. Successful processing means only that the software accepted, protected, extracted, indexed, and retrieved synthetic text; it does not validate the accuracy or suitability of any investigative conclusion.

Synthetic record

Record reference: SYN-OBS-0042. Fictional preparation date: 2026-10-20. Fictional location label: North Sample Room. These values were generated for software testing and do not identify a real person, place, or event.

The fictional note states that a blue folder was listed in a sample inventory, alongside a paper tag marked SAMPLE-17. The note does not assert that either item is connected to a real incident. The purpose of this sentence is to provide ordinary, extractable text for chunking and retrieval tests.

Retrieval validation text

BLUE ORCHID 7319 is the unique synthetic retrieval marker for this test fixture. If the PDF is successfully extracted and indexed, a search for the phrase “BLUE ORCHID 7319” should be capable of returning a passage containing this marker, subject to the configured embedding model, chunking rules, and similarity threshold.

Additional synthetic content: The sample inventory lists a sealed envelope, a blue folder, and a reference card. Each item is a fictional test label. No conclusion, identity match, cause, or responsibility is inferred from these entries.

Expected validation checks

• The upload endpoint accepts the PDF when the case and caller are authorized.

• The evidence pipeline completes the configured validation, scanning, commitment, integrity, and object-lock stages.

• The pipeline response reports the evidence identifier, SHA3-512 checksum, and object-lock storage reference.

• The response reports a document identifier and indexing status when indexing is supported and successful.

• A case-scoped search can retrieve the unique marker and return source provenance for the indexed evidence.

End of synthetic test fixture. Keep this file in a test environment and use a fresh, isolated SAKSHI test case.
